IT Infrastructure

The ACE System is designed to be both robust and versatile. This principle applies to the IT infrastructure solutions available to our customers, whether they run large, resource intensive operations or smaller venues where cost efficiency is key. With options ranging from automated fail-over redundancy solutions and off-site backups to entry-level server configuration, we can provide the infrastructure to suite your venue and your budget.

Server Architecture

ACE System servers are the backbone of our product, using the very latest in server technology to ensure that our customers' operations run smoothly and efficiently. We pride ourselves in providing an energy-efficient, virtualised server solution, whilst still delivering ultimate performance. At the heart of our architecture is the database server, securely storing all operational data and connecting to the gaming floor servers that drive the slots and tables floor. Our infrastructure is constructed to be easily scalable, allowing for valuable flexibility when adding or removing machines and tables from your operation. With virtualisation technology, we can increase the capabilities of your server network in a fast and affordable way.

Backup & Redundancy Solutions

Ranging from low cost, on-site backup options using network attached storage (NAS) to our premier package, utilising fully-automated redundancy and off-site cloud backups, we tailor a server solution to suit each of our customer's requirements. Our on-site solutions provide assurance that all operational and sensitive data is stored and protected, whilst our fail-over options allow our customers to operate in the knowledge that in the rare event of hardware failure, any resulting operational downtime will be no more than a matter of seconds.

Support

With extensive experience in both leading and emerging markets, we understand the importance of providing quick resolutions in a timely, efficient and professional manner.
